

AMENDMENTS TO THE CLAIMS

This listing of the claims will replace all prior versions or listings of the claims in this application.

Listing of Claims:

1. (Previously presented) Macromolecular compounds with having the structure:
(nuc-linker)_n-marker
wherein:

Nuc—nuc is a nucleotide or nucleoside (nuc-component) having a base selected independently from the group consisting of purine nucleobases, pyrimidine nucleobases and analogs of purine or pyrimidine nucleobases capable of forming Watson-Crick-base pairing;

Linker-linker is a linker component comprising the following parts:

a) Coupling coupling unit L, which provides the linkage between nuc and the rest of the linker, and

b) Polymer polymer, which is a water-soluble polymer with an average length between 50 and 20,000 atoms (chain atoms), and

c) Coupling coupling unit T which provides the linkage between the marker and the rest of the linker[[:]],

Marker marker is a marker component comprising at least one macromolecule of at least 2000 Da, a plurality of low molecular weight marker units or a combination of at least one low molecular weight marker unit with a molecular weight below 2000 Da and at least one macromolecular marker unit with a molecular weight of at least 2000 Da; and
(n) is a positive integer between 1 and 100.

2. (Currently amended) The macromolecular compounds according to claim 1, wherein the nuc-component comprises the following structures structure:

Wherein wherein:

base is selected independently from the group consisting of purine nucleobases, pyrimidine nucleobases and analogs of purine or pyrimidine nucleobases capable of forming Watson-Crick-base pairing, and L is the coupling unit of the linker (L) which connects said base and a marker component.

the length of the linker is in the range of from 50 to 20000 chain atoms,

said linker is attached covalently to the base at the coupling position X which is selected independently from the group consisting of positions 4 or 5 when the base is a pyrimidine nucleobase, positions 6 or 8 when the base is a purine nucleobase, position 7 when the base is a 7-deaza-purine nucleobase, and

Base is selected independently from the group of adenine, or 7-deazaadenine, or guanine, or 7-deazaguanine, or thymine, or cytosine, or uracil, or their modifications, wherein X is the coupling position of the linker to the base and L is the coupling unit of the linker (L).

R₁ - is H₁

R₂ - is selected independently from the group of H, OH, halogen, NH₂, SH or protected OH group,

R₃ - is selected independently from the group of H, OH, halogen, PO₃, SH, N₃, NH₂, O-CH₃, O-CH₂-O-CH₃, O-CH₂-CH=CH₂, O-R₃₋₁, P(O)_m-R₃₋₁ ((m) is 1 or 2), NH-R₃₋₁, S-R₃₋₁, Si-R₃₋₁ wherein R₃₋₁ is a chemically, photochemically or enzymatically cleavable group.[.]]

R₄ - is H or OH, and

R₅ - is selected independently from the group of OH, or a protected OH group, or a monophosphate group, or a diphosphate group, or a triphosphate group, or is an alpha thiotriphosphate group.

3. (Currently Amended) The macromolecular compounds according to claim 1, wherein the nuc-component comprises the following structures structure:

wherein:

Base base is selected independently from the group of adenine, or 7-deazaadenine, or guanine, or 7-deazaguanine, or thymine, or cytosine, or uracil, or their modifications capable of enzymatic reactions₁[[.]]

R₁ - is H₁

R₂ - is selected independently from the group of H, OH, halogen, NH₂, SH or protected OH group,

R₃ - is selected independently from the group of O- R₃₋₂-L, P(O)_m- R₃₋₂-L and (m) is 1 or 2, NH-R₃₋₂-L, S-R₃₋₂-L, Si-R₃₋₂-L, wherein R₃₋₂ is the coupling position of the linker to the nucleotide and L is the coupling unit of the linker (L)₁[[.]]

R₄ - is H or OH, and

R₅ - is selected independently from the group of OH, or a protected OH group, or a monophosphate group, or a diphosphate group, or a triphosphate group, or is an alpha-thiotriphosphate group.

4. (Currently Amended) The macromolecular compounds according to claim 1, wherein the nuc-component comprises the following ~~structures~~ structure:

wherein:

Base base is selected independently from the group of adenine, or 7-deazaadenine, or guanine, or 7-deazaguanine, or thymine, or cytosine, or uracil, or their modifications capable of enzymatic reactions₁[[.]]

R_1 - is H_x

R_2 - is selected independently from the group of H, OH, halogen, NH_2 , SH or protected OH group,

R_3 - is selected independently from the group of H, OH, halogen, PO_3 , SH, NH_2 , $O-R_{3-1}$, $P(O)_m-R_{3-1}$ ((m) is 1 or 2), $NH-R_{3-1}$, $S-R_{3-1}$, $Si-R_{3-1}$ wherein R_{3-1} is a chemically, photochemically or enzymatically cleavable group,[[.]]

R_4 - is H or OH_x and

R_5 - is selected independently from the group of O- R_{5-1} -L, or P-(O) $_3$ - R_{5-1} -L (modified monophosphate group), or P-(O) $_3$ -P-(O) $_3$ - R_{5-1} -L (modified diphosphate group) or P-(O) $_3$ -P-(O) $_3$ -P-(O) $_3$ - R_{5-1} -L (modified triphosphate group), wherein R_{5-1} is the coupling position of the linker to the nucleotide and L is the coupling unit of the linker (L).

5. (Currently Amended) The macromolecular compounds according to any one of claims 1 to 4, wherein the coupling unit (L) of the linker comprises the following structural elements:

R_6 -NH- R_7 , R_6 -O- R_7 , R_6 -S- R_7 , R_6 -SS- R_7 , R_6 -CO-NH- R_7 , R_6 -NH-CO- R_7 , R_6 -CO-O- R_7 , R_6 -O-CO- R_7 , R_6 -CO-S- R_7 , R_6 -S-CO- R_7 , R_6 -P(O) $_2$ - R_7 , R_6 -Si- R_7 , R_6 -(CH_2) $_n$ - R_7 , R_6 -(CH_2) $_n$ - R_7 , R_6 -A-(CH_2) $_n$ - R_7 , R_6 -(CH_2) $_n$ -B- R_7 , R_6 -(CH=CH) $_n$ - R_7 , R_6 -(A-CH=CH) $_n$ - R_7 , R_6 -(CH=CH-B) $_n$ - R_7 , R_6 -A-CH=CH-(CH_2) $_n$ - R_7 , R_6 -(CH=CH- CH_2) $_n$ -B- R_7 , R_6 -(C≡C) $_n$ - R_7 , R_6 -(A-C≡C) $_n$ - R_7 , R_6 -(C≡C-B) $_n$ - R_7 , and R_6 -A-C≡C-(CH_2) $_n$ - R_7 , R_6 -(C≡C- CH_2) $_n$ -B- R_7 , R_6 -(C≡C- CH_2 - CH_2) $_n$ -B- R_7 ,

wherein R_6 is the nuc-component, R_7 is the rest of the linker, and A and B comprise the following structural elements: -NH-, -O-, -S-, -SS-, -CO-NH-, -NH-CO-, -CO-O-, -O-CO-, -CO-S-, -S-CO-, -P(O) $_2$ -, -Si-, -(CH_2) $_n$, wherein (n) ranges from 1 to 5, a photolabile group.

6. (Previously Presented) The macromolecular compounds according to claim 1, wherein the linker-component comprises a water-soluble polymer.

7. (Currently Amended) The macromolecular compounds according to claim 6, wherein the linker-component comprises water-soluble polymers selected independently from the following group:

polyethylene glycol (PEG), polysaccharides, dextran, polyamides, polypeptides, polyphosphates, polyacetates, polyalkyleneglycoles, copolymers from ethyleneglycol and propyleneglycol, polyolefinic alcohols, polyvinylpyrrolidones, poly(hydroxyalkylmethacrylamides), polyhydroxyalkylmethacrylates, poly(x-hydroxy) acids, polyacrylic acid, polyacrylamide, and polyvinylalcohol.

8. (Previously Presented) The macromolecular compounds according to claim 1, wherein the average length of at least one linker component ranges between 50 to 100, 100 to 200, 200 to 500, 500 to 1000, 1000 to 2000, 2000 to 10000, 10000 to 50000 atoms (chain atoms).

9. (Previously Presented) The macromolecular compounds according to claim 1, wherein the marker component has one of the following functions: signal-giving function, signal-transmitting function, catalytic function or affine function.

10. (Previously Presented) The macromolecular compounds according to claim 1, wherein the marker component consists of at least one macromolecular structural marker unit.

11. (Previously Presented) The macromolecular compounds according to claim 1, wherein the marker component consists of a plurality of structural marker units

12. (Previously Presented) The macromolecular compounds according to claim 11, wherein the marker component consists of at least five marker units independently selected from the group of elements consisting of biotin, hapten, radioactive isotope, rare-earth atom, dye, and fluorescent dye.

13. (Previously Presented) The macromolecular compounds according to claim 10, wherein a structural marker unit independently comprises one of the following elements: nanocrystals or their modifications, proteins or their modifications, nucleic acids or their modifications, particles or their modifications.

14. (Currently Amended) The macromolecular compounds according to claim 13, wherein a structural marker unit comprises one of the following proteins:

enzymes or their conjugates or modifications,
antibodies or their conjugates or modifications,
streptavidin or its conjugates or modifications, and
avidin or its conjugates or modifications

15. (Previously Presented) The macromolecular compounds according to claim 13, wherein a structural marker unit comprises one of the following types of nucleic acid chains:

DNA, RNA, PNA, wherein the length of nucleic acid chains ranges between 10 and 10,000 nucleotides.

16. (Currently Amended) The macromolecular compounds according to claim 11, wherein several structural marker units are bound to at least one core component of the marker and this core component independently comprises one of the following elements:

water-soluble polymer from the group of: polyamides (e.g. polypeptides),
polyacrylic acid and its derivatives,
polyacrylamides and their derivatives,
polyvinylalcohols and their derivatives, nucleic acids and their derivatives,
streptavidin or avidin and their derivatives, and
dendrimers, whereas these elements can be linear or branched or crosslinked with each other.

17. (Previously Presented) The macromolecular compounds according to claim 16, wherein the linkage between several structural marker units and the core component is covalent or affine.

18. (Previously Presented) The macromolecular compounds according to claim 1, wherein the linkage between the marker and the linker is covalent or affine.

19. (Previously Presented) The macromolecular compounds according to claim 16, wherein the linkage between the core component and the linker is covalent or affine.

20. (Previously Presented) The macromolecular compounds according to claim 1, wherein only one nuc-component with one linker component is linked to the marker component, wherein the linker length ranges between 50 to 100, 100 to 200, 200 to 500, 500 to 1000, 1000 to 2000, 2000 to 5000 atoms.

21. (Previously Presented) The macromolecular compounds according to claim 1, wherein only one nuc-component with one linker component is linked to the marker component, wherein the linker length ranges between 50 to 100, 100 to 200, 200 to 500, 500 to 1000, 1000 to 2000, 2000 to 5000 atoms and the linker component comprises one or several compounds that are cleavable under mild conditions.

22. (Previously Presented) The macromolecular compounds according to claim 1, wherein only one nuc-component with one linker component is linked to the marker component, wherein the linker length ranges between 50 to 100, 100 to 200, 200 to 500, 500 to 1000, 1000 to 2000, 2000 to 5000 atoms and one or several parts of the ~~nuc-macromolecule~~macromolecular compound are modified in such a way, that only one nuc-component can be incorporated into the growing strand.

23. (Previously Presented) The macromolecular compounds according to claim 1, wherein several nuc-components are each coupled to one marker component via a linker, wherein the length of each respective linker component ranges between 50 to 100, 100 to 200, 200 to 500, 500 to 1000, 1000 to 2000, 2000 to 5000 atoms.

24. (Previously Presented) The macromolecular compounds according to claim 1, wherein several nuc-components are each coupled to one marker component via a linker, wherein the length of each respective linker component ranges between 50 to 100, 100 to 200, 200 to 500, 500 to 1000, 1000 to 2000, 2000 to 5000 atoms and each respective linker component comprises one or several compounds that are cleavable under mild conditions.

25. (Previously Presented) The macromolecular compounds according to claim 1, wherein several nuc-components are each coupled to one marker component via a linker, wherein the length of each respective linker component ranges between 50 to 100, 100 to 200, 200 to 500, 500 to 1000, 1000 to 2000, 2000 to 5000 atoms, and one or several parts of the ~~nuc-macromolecule~~ macromolecular compound are modified in such a way that only one nuc-component can be incorporated into the growing nucleic acid chain.

26. (Currently Amended) Oligonucleotides or polynucleotides comprising at least one macromolecular compound ~~nuc-macromolecule~~ according to any one of claims 1 to 4 and 6 to 25 to-25 per one nucleic acid chain, obtained by an enzymatic incorporation of the said ~~nuc-macromolecule~~ macromolecular compounds into an according oligonucleotide or polynucleotide.

27. (Previously Presented) The oligonucleotides or polynucleotides according to claim 26, wherein oligo- or polynucleotides are RNA or DNA or PNA and their length ranges between 5 and 50,000 nucleotides.

28. (Currently Amended) A method of enzymatic modification of nucleic acid chains, wherein at least one of ~~nuc-macromolecule~~ macromolecular compounds according to any one of claims ~~1 to 25~~ 1 to 4 and 6 to 25 is used in an enzymatic coupling reaction, comprising the following steps:

- a) providing of at least one population of nucleic acid chains, and
- b) incubating at least one type of the macromolecular compound (~~nuc-macromolecule~~) according to any one of claims 1 to 4 and 6 to 25 together with at least one type of enzyme with provided nucleic acid in step (a) under conditions which allow for incorporation of the said macromolecular compound into the said nucleic acid chain.

29. (Currently Amended) The method according to the claim 28, wherein the modification is accomplished by an enzymatic coupling and the reaction mixture comprises the following components:

[[-]] at least one type of nucleic acid molecule macromolecular compounds or their intermediate stages according to the claims 1 to 25 any one of claims 1 to 4 and 6 to 25, wherein every type of nucleic acid molecule macromolecular compound is distinctively labeled,

[[-]] at least one population of the nucleic acid chains, and

[[-]] at least one type of enzyme for coupling nucleic acid molecule macromolecular compounds to the nucleic acid chains[[.]].

30. (Previously Presented) The method according to claim 29, wherein the modification is accomplished by an enzymatic coupling and the reaction mixture comprises additionally at least one other type of nucleoside triphosphates.

31. (Previously Presented) The method according to claim 29, wherein the said type of enzyme independently comprises one of the following groups: DNA-polymerases, RNA-polymerases, terminal transferases.

32. (Previously Presented) The method according to claim 30, wherein the "other type" of nucleoside tri-phosphates is independently selected from the group of ribonucleoside triphosphates (ATP, GTP, UTP, CTP) or their derivatives, 2'-deoxyribonucleoside triphosphates (dATP, dUTP, dTTP, dCTP, dGTP) or their derivatives, and 2',3'-dideoxynucleoside triphosphates (ddATP, ddGTP, ddUTP, ddCTP, ddTTP) or their derivatives.

33. (Previously Presented) The method according to claim 32, wherein the "other type" of nucleoside tri-phosphates is conventionally modified nucleotides with a label, wherein the said label is independently selected from the group of fluorescent dye, biotin, hapten or radioactive element.

34. (Currently Amended) The method according to claim 29, wherein at least two different populations of nucleic acid chains are present.

35. (Previously Presented) The method according to claim 34, wherein at least one of the populations of the nucleic acid chains has a primer function and at least one population of the nucleic acid chains has a template function.

36. (Canceled).

37. (Previously Presented) The method according to claim 29, wherein ~~nuc-~~macromolecule macromolecular compounds which allow for the coupling of only single nucleic acid component into the growing nucleic acid strand are used for the labeling process and multiple incorporations are prevented by modifications of the nucleic acid component and/or the linker component and/or the marker component.

38. (Previously Presented) The method according to claim 37, wherein the multiple coupling is prevented reversibly.

39. (Previously Presented) The method according to claim 37, wherein the multiple coupling is prevented irreversibly.

40. (Previously Presented) The method according to claim 29 wherein ~~nuc-~~macromolecule macromolecular compounds are used which allow for the coupling of multiple nucleic acid components into the growing nucleic acid strand.

41. (Previously Presented) The method according to claim 29, wherein at least one population of the nucleic acid chains participating in the reaction is coupled to a solid phase and has an addressable position.

42. (Previously Presented) The method according to claim 41, wherein the said nucleic acid chains compose a uniform population.

43. (Previously Presented) The method according to claim 41, wherein the said nucleic acid chains compose two or more different populations and each of the populations has an addressable position on the solid phase.

44. (Previously Presented) the method according to claim 41, wherein the coupling of ~~nuc-macromolecule~~ macromolecular compounds is conducted on the uniform population of nucleic acid molecules attached to the solid phase and the marker component of the ~~nuc-macromolecule~~ macromolecular compound remains on the extended nucleic acid strand after the coupling and is not cleaved off.

45. (Previously Presented) The method according to claim 41, wherein the coupling of the ~~nuc-macromolecule~~ macromolecular compounds is conducted on the uniform population of nucleic acid chains attached to the solid phase and the marker component or its individual parts are cleaved off, with or without the linker component of the ~~nuc-macromolecule~~ macromolecular compound, from the nuc-component incorporated into the growing nucleic acid strand, the cleaving-off taking place during or after the coupling.

46. (Previously Presented) The method according to claim 41, wherein the coupling of ~~nuc-macromolecule~~ macromolecular compounds in a reaction mixture is conducted simultaneously on two or more different populations of nucleic acid chains attached to the solid phase, wherein each of these populations has distinct addressable positions on the solid phase, and the marker component of the ~~nuc-macromolecule~~ macromolecular compound remains on the extended nucleic acid strand after the coupling and is not cleaved off.

47. (Previously Presented) The method according to the claim 41, wherein the coupling of ~~nuc-macromolecule~~ macromolecular compounds is conducted simultaneously on two or more different populations of nucleic acid chains attached to the solid phase, wherein each of these populations has distinct addressable positions on the solid phase, and the marker component or its individual parts are cleaved off, with or without linker component of the ~~nuc-macromolecule~~ macromolecular compound, from the nuc-component, the cleaving-off taking place during or after the coupling.

48. (Previously Presented) The method according to claim 41, wherein the addressable positions having nucleic acid molecules on the solid phase are distributed as spots on a plane surface, and nucleic acid molecules are uniform on each spot.

49. (Previously Presented) The method according to the claim 41, wherein the addressable positions having nucleic acid molecules are fastened on the beads or particles and nucleic acid molecules are uniform for each bead or particle.

50. (Previously Presented) The method according to claim 41, wherein the addressable positions having nucleic acid molecules are distributed in a multivessel array, like a microtiter plate or nanotiter plate or picotiter plate, wherein the nucleic acid molecules are uniform in one vessel of the multivessel array.

51. (Withdrawn-Currently Amended) The method according to the claim 28, ~~which comprises the following steps~~ further comprising the steps of:

a) ~~Providing of~~ c) providing at least one population of single-stranded nucleic acid chains (NAC),

b) ~~Hybridizing~~ d) hybridizing primers to these nucleic acid chains, whereas extendable NAC primer complexes are formed,

~~e) Incubation of~~ e) incubating at least one type of the ~~nue-maeromoleeule~~ macromolecular compound according to claims 1 to ~~25~~ 4 and 6 to 25 together with at least one type of polymerase according to claim 31 with provided NAC primer complexes in steps (a) and (b) ~~(c) and (d)~~ under conditions which allow for incorporation of complementary ~~nue-maeromoleeule~~ macromolecular compounds, and each kind of the ~~nue-maeromoleeule~~ macromolecular compound having a distinctive label,

~~d) Removal of~~ f) removing the unincorporated ~~nue-maeromoleeule~~ macromolecular compounds from the NAC primer complexes,

~~e) Detection of~~ g) detecting the signals from the ~~nue-maeromoleeule~~ macromolecular compounds which are incorporated in the NAC primer complexes,

~~f)~~ h) removing the linker component and the marker component from the ~~nue-maeromoleeule~~ macromolecular compounds which are incorporated in the NAC primer complexes,

~~g)~~ Wash i) washing the NAC primer complexes, and
if necessary, repetition of the steps ~~(e) to (g)~~ (e) to (i).

52. (Previously Presented) The method according to claim 51, wherein the nucleic acid chains are coupled to a solid phase in a random arrangement.

53. (Withdrawn-Currently Amended) The method according to claim 28 for the parallel sequence analysis of nucleic acid sequences (nucleic acid chains, NACs), in which fragments (NACFs) of single-stranded NACs with a length of approximately 50 to 1000 nucleotides that may represent overlapping partial sequences of the whole sequence are produced,

whercin:

the NACFs are bonded to a reaction surface in a random arrangement using a uniform or several different primers in the form of NACF primer complexes,

a cyclical synthesis reaction of the complementary strand of the NACFs is performed using one or more polymerases by:

a) (a1) adding, to the NACF primer complexes bonded to the surface, a solution containing one or more polymerases and one to four ~~nue-maeromoleeule~~ macromolecular compounds according to one of the claims 1 to 5 that have a marker component labeled with fluorescent dyes, wherein the fluorescent dyes, which each are located on the marker component when at least two ~~nue-maeromoleeule~~ macromolecular compounds are used simultaneously, are chosen in such a manner that the ~~nue-maeromoleeule~~ macromolecular compounds used can be distinguished from one another by measurement of different fluorescent signals, the ~~nue-maeromoleeule~~ macromolecular compounds being structurally modified in such a manner that the polymerase is not capable of incorporating another ~~nue-maeromoleeule~~ macromolecular compound in the same strand after such a ~~nue-maeromoleeule~~ macromolecular compound has been incorporated in a growing complementary strand, the linker component and marker component being cleavable,

b) (b1) incubating the stationary phase obtained in step a) (a1) under conditions suitable for extending the complementary strands, the complementary strands each being extended by one ~~nuc-macromolecule~~ macromolecular compound.

e) (c1) washing the stationary phase obtained in step b) (b1) under conditions suitable for removing ~~nuc-macromolecule~~ macromolecular compounds that are not incorporated in a complementary strand,

d) (d1) detecting the single ~~nuc-macromolecule~~ macromolecular compounds incorporated in complementary strands by measuring the characteristic signal of the respective fluorescent dye, the relative position of the individual fluorescent signals on the reaction surface being determined at the same time,

e) (e1) cleaving-off the linker component and marker component of the nuc-components added to the complementary strand in order to produce unlabeled (nucleotides or) NACFs,

f) (f1) washing the stationary phase obtained in step e) under conditions suitable for the removal of the marker component, and

repeating steps a) (a1) to f) (f1), several times if necessary,

the relative position of individual NACF primer complexes on the reaction surface and the sequence of these NACFs being determined by specific assignment of the fluorescent signals, which were detected in the respective positions in step d) (d1) during successive cycles, to the ~~nuc-macromolecule~~ macromolecular compounds.

54. (Withdrawn-Currently Amended) The method according to claim 53, characterized in that steps a) (a1) to f) (f1) of the cyclical synthesis reaction are repeated several times, only one type of ~~nuc-macromolecule~~ macromolecular compound being used in each cycle.

55. (Withdrawn-Currently Amended) The method according to claim 53 characterized in that steps (a1) to (f1) ~~a) to f)~~ of the cyclical synthesis reaction are repeated several times, two types of differently labeled ~~nuc-macromolecule~~ macromolecular compounds being used in each cycle.

56. (Withdrawn-Currently Amended) the method according to claim 53 characterized in that steps (a) to (f) ~~a) to f)~~ of the cyclical synthesis reaction are repeated several times, four types of differently labeled ~~the macromolecule~~ macromolecular compounds being used in each cycle.

57. (Canceled).

58. (Withdrawn-Previously Presented) The method according to claim 53 characterized in that a primer binding site (PBS) is introduced in each of the NACFs, one PBS being introduced at both complementary single strands in the case of double-stranded NACs and the primer binding sites displaying identical or different sequences for all NACFs.

59. (Withdrawn-Previously Presented) The method according to claim 53 characterized in that the NACFs are brought into contact with primers in a solution under conditions suitable for the hybridization of the primers to the primer binding sites (PBSs) of the NACFs, the primers exhibiting identical or different sequences to one another, and the NACF primer complexes formed then being bonded to the reaction surface.

60. (Withdrawn-Previously Presented) The method according to claim 53 characterized in that the NACFs are first of all immobilized on the reaction surface and only then brought into contact with primers under conditions suitable for the hybridization of the primers to the primer binding sites (PBSs) of the NACFs, NACF primer complexes being formed, the primers exhibiting identical or different sequences to one another.

61. (Withdrawn-Previously Presented) The method according to claim 53, wherein the incorporation reaction is being performed simultaneously on 10 to 100,000 different sequence populations.

62. (Withdrawn-Previously Presented) The method according to claim 53 wherein the incorporation reaction is being performed simultaneously on 100,000 to 100,000,000 different sequence populations.

63. (Withdrawn-Previously Presented) The method according to claim 51, wherein sequences of the nucleic acid chains are determined.

64. (Withdrawn-Previously Presented) The method according to claim 28, wherein the marker component is fluorescently labeled.

65. (canceled)

66. (Currently Amended) A kit comprising at least one kind of ~~nuc~~-macromolecule macromolecular compound (macromolecular compounds) according to ~~claims 1 to 25~~ any one of claims 1 to 4 and 6 to 25.

67. (canceled)

68. (Previously Presented) A method of using the macromolecular compounds according to claim 26 in an enzymatic reaction comprising: polymerases, ligases, or nucleases (endo or exonucleases).
